

Collection and Processing of Recyclables

A decorative architectural frame in a light gray color, featuring two columns with fluted shafts and spiral capitals, supporting a horizontal beam with a row of small circular motifs along its top edge.

Stanford Recycling

◆ Basic Recyclables

- ◆ Collect bottles and cans, mixed paper, corrugated cardboard.
- ◆ Over 3800 recycling bins on campus
- ◆ Recycling bins are serviced once per week.

Stanford Recycling

◆ Organics Program

- ◆ Yard Waste
- ◆ Wood Waste
- ◆ Grasscycling
- ◆ Turning Woody Brush into Mulch
- ◆ Turning Logs into Wood Chips
- ◆ Food Waste

Stanford Recycling

- ◆ Construction and Demolition Debris
- ◆ Scrap Metal
- ◆ Scrap Electronics including cell phones and consumer electronic devices
- ◆ Batteries
- ◆ Toner Cartridges

Stanford Recycling

◆ Reduce Waste

- ◆ Double-side copy
- ◆ Use Draft Paper

◆ Reuse

- ◆ SUMarket
- ◆ Material Exchange Store

◆ Education

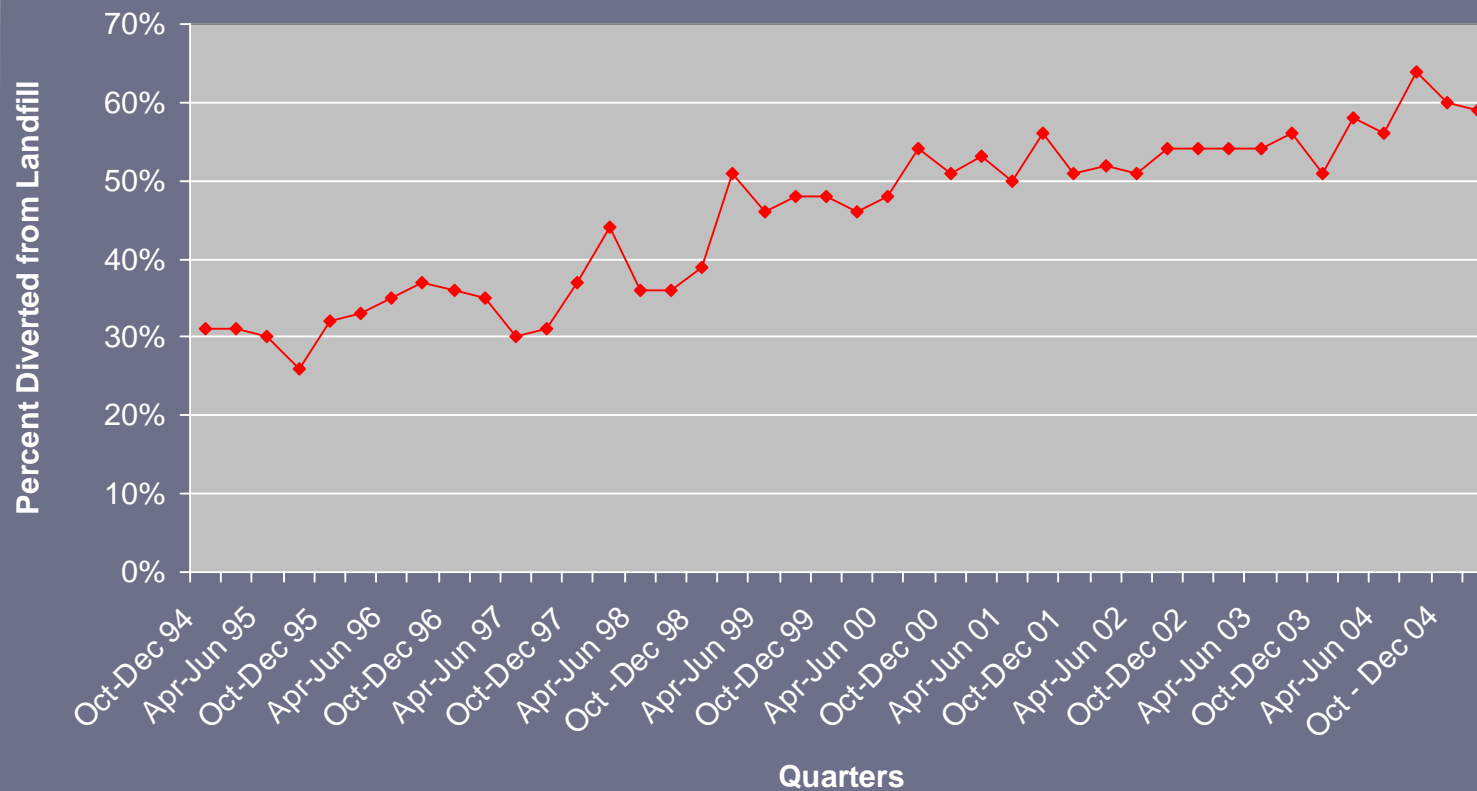

- ◆ Internship Program

Summary - 60% Diversion!

Material	% of Discards
Basic Recyclables	19%
Organics	25%
Construction	16%
2004 Diversion Rate	60%

Stanford University's Diversion Rate 1994-2004

Streams of Recyclables

◆ Why is how you collect the material important?

- ◆ How you collect will determine what type of material you will have to market and what kind of salvage revenue you will receive to support your program.
- ◆ Because recycling manufacturers are relying on a steady and consistent supply of recyclable materials generated from your recycling programs.

Streams of Recyclables

◆ Multi-Stream

- ◆ Single categories of material
- ◆ Pros: clean sorted material, reduce labor
- ◆ Cons: requires multiple containers and generator support
- ◆ Other?

Streams of Recyclables

◆ Dual-Stream

- ◆ Two streams - all bottles and cans and all paper in two separate bins
- ◆ Pros: relatively clean paper that can be sold as mixed paper, less collections bins
- ◆ Cons: Needs to be sorted in order to high grade material. Bottles and cans need to be sorted.
- ◆ Other?

Streams of Recyclables

◆ Single-Stream

- ◆ All bottles and cans and paper in the same bin
- ◆ Pros: More efficient collection, less collection bins
- ◆ Cons: More contaminants collected, paper contaminated by glass and plastic residue, markets
- ◆ Other?

Streams of Recyclables

- ◆ Question: Which should you pick?
- ◆ Answer: It depends on your internal collection system, local markets, and local government system.
 - ◆ Material Recovery Facilities
 - ◆ Transfer Stations
 - ◆ Dirty MRFs

The End of the Line

The End of the Line

The Extras

Why Do We Sort?

- ◆ Want flexibility in the market
- ◆ Want higher salvage revenue
 - ◆ Want California Refund Value
- ◆ Highest and best use of material
- ◆ Reduce cost on collections
- ◆ Clean up contamination
- ◆ Others?

Does It Make Sense to Sort?

- ◆ Sometimes yes, and sometimes no.
- ◆ Depends on what the market is doing
- ◆ Depends on your local conditions
- ◆ Bottles and cans

Considerations

- ◆ Space
- ◆ Funding
- ◆ Material Type
- ◆ Local Markets
- ◆ Transportation

Costs to Sort

- ◆ How much does it cost to sort?
 - ◆ Measured in Dollars Per Ton
 - ◆ Depends on how much you have to sort
- ◆ Labor Costs (The Biggest Cost)
- ◆ Equipment Costs (Amortized over 5 to 7 Years)
- ◆ Upgrades in equipment should reduce labor costs.
- ◆ Baling equipment can bring increased revenue.

Paper

Grade	Current Price	Average Price
Mixed Paper	\$97.00	\$40.99
Super Mix	\$90.00	\$59.78
OP1	\$95.00	
OP2	\$65.00	\$54.87
White Ledger	\$180.00	\$160.34

Challenges to Sorting

- ◆ Market Fluctuation
- ◆ Keeping Productivity Up
- ◆ Updating Equipment
- ◆ Maintaining Equipment
